1 Practical Questions

1.1 WAP to compute the roots of a quadratic equation.

[21]:
```python
a = float(input("Enter the coefficient of x\N{SUPERSCRIPT TWO}: "))
if a==0:
    print("Not a quadratic equation.\nThe coefficient of x\N{SUPERSCRIPT TWO},␣
 ↪needs to be non-zero.")
else:
    b = float(input("Enter the coefficient of x: "))
    c = float(input("Enter the constant term: "))
    # Formatting the equation for maximum readability.
    print(f"Given equation is:\n{a}x\N{SUPERSCRIPT TWO}{"" if b==0 else str(" +␣
 ↪" if b>0 else " - ")+str(abs(b))+"x "}{"" if c==0 else str("+ " if c>0 else␣
 ↪"- ")+str(abs(c))}")
    from math import sqrt
    # Discriminant
    d = b*b-4*a*c
    if d>0:
        d = sqrt(d)
        root1 = (-b+d)/(2*a)
        root2 = (-b-d)/(2*a)
        print(f"Roots are x = {root1:2.2f}, {root2:2.2f}")
    elif d == 0:
        d = sqrt(d)
        root1 = (-b+d)/(2*a)
        print(f"Root is x = {root1:2.2f}")
    else:
        print(f"Since, discriminant ({d}) < 0\nTherefore, no real roots exist.")
```

```
Given equation is:
1.0x² + 2.0x + 1.0
Root is x = -1.00
```

1.2 WAP to play Stone, Paper, Scissors with Computer.

[22]:
```python
u = int(input(f"1. Stone\n2. Paper\n3. Scissors\nEnter your choice (1/2/3): "))
if u>3 or u<1:
    print("Incorrect Choice. Please choose from 1/2/3.")
else:
    from random import randint
    c = randint(1,3)
    l = ['Stone', 'Paper', 'Scissors']
    print(f"You Picked -> {l[u-1]}\nComputer Picked -> {l[c-1]}")
    print("\nResult -> ",end="")
    if u==c:
        print("Draw")
    elif (u==1 and c==3) or (u==2 and c==1) or (u==3 and c==2):
```

```
        print("You Won!")
    else:
        print("Computer Won!")
```

```
You Picked -> Paper
Computer Picked -> Stone

Result -> You Won!
```

1.3 Write a program for BMI Calculator with Categorization of underweight, normal weight and overweight.

BMI Categories
Underweight: $BMI < 18.5$
Normal weight: $18.5 <= BMI < 24.9$
Overweight: $25 <= BMI < 29.9$
Obesity: $BMI >= 30$

[23]:
```
# Input: weight (kg) and height (m)
weight = float(input("Enter your weight in kg: "))
height = float(input("Enter your height in meters: "))

print(f"Weight: {weight}kg")
print(f"Height: {height}m")
bmi = weight / (height ** 2)

print(f"Your BMI is: {bmi:.2f}")

# Categorization
if bmi < 18.5:
    print("You are underweight.")
elif 18.5 <= bmi < 24.9:
    print("You have a normal weight.")
elif 25 <= bmi < 29.9:
    print("You are overweight.")
else:
    print("You are obese.")
```

```
Weight: 70.0kg
Height: 169.5m
Your BMI is: 0.00
You are underweight.
```

1.4 WAP to demonstrate exception handling of Zero Division Error.

[24]:
```
a = int(input("Enter Dividend: "))
b = int(input("Enter a Divisor: "))
```

```
try:
    c = a/b
    print(f"{a}/{b} = {c}")
except ZeroDivisionError as e:
    print("Division by 0 is not possible.")
```

```
Division by 0 is not possible.
```

1.5 WAP to demonstrate OOPs using user defined Cuboid Class.

[25]:
```
class Cuboid:
    def __init__(self, l, b, h):
        self.ln = l
        self.br = b
        self.hi = h
    def peri(self):
        """Compute perimeter of the cuboid."""
        return 4*(self.ln+self.br+self.hi)
    def vol(self):
        """Compute volume of the cuboid."""
        return self.ln*self.br*self.hi
c1 = Cuboid(1,2,3)
perimeter = c1.peri()
volume = c1.vol()
print(f'Perimeter is {perimeter}')
print(f'Volume is {volume}')
```

```
Perimeter is 24
Volume is 6
```

1.6 WAP to demonstrate inheritance in OOPs using user defined Rectangle and Cuboid Class.

[26]:
```
class Rectangle:
    def __init__(self, l, b):
        self.ln = l
        self.br = b
    def peri(self):
        """Compute perimeter of the rectangle."""
        return 2*(self.ln+self.br)
    def area(self):
        """Compute area of the rectangle."""
        return self.ln*self.br

class Cuboid(Rectangle):
    def __init__(self, l, b, h):
        super().__init__(l, b)
        self.hi = h
```

```
    def vol(self):
        """Compute volume of the cuboid."""
        return self.area()*self.hi
    def peri(self):
        """Compute perimeter of the cuboid."""
        return 4*(self.ln+self.br+self.hi)

c2 = Cuboid(3,2,3)
perimeter = c2.peri()
volume = c2.vol()
print(f'Perimeter is {perimeter}')
print(f'Volume is {volume}')
```

```
Perimeter is 32
Volume is 18
```

1.7 Write a Program to implement Inheritance. Create a class Employee inherit two classes Manager and Clerk from Employee.

[27]:
```
class Employee:
    def __init__(self, empid, name, age, salary):
        self.empid = empid
        self.name = name
        self.age = age
        self.salary = salary

    def display_info(self):
        print(f"Employee ID: {self.empid}")
        print(f"Name: {self.name}")
        print(f"Age: {self.age}")
        print(f"Salary: {self.salary}")

class Manager(Employee):
    def __init__(self, empid, name, age, salary, department):
        super().__init__(empid, name, age, salary)
        self.department = department

    def display_manager_info(self):
        self.display_info()
        print(f"Department: {self.department}")
        print("Position: Manager")

class Clerk(Employee):
    def __init__(self, empid, name, age, salary, experience):
        super().__init__(empid, name, age, salary)
        self.experience = experience
```

```
    def display_clerk_info(self):
        self.display_info()
        print(f"Experience: {self.experience} years")
        print("Position: Clerk")

manager = Manager(32347 ,"Rahul", 45, 120000, "HR")
clerk = Clerk(12345, "Ashish", 30, 40000, 5)

print("Manager Details:")
manager.display_manager_info()

print("\nClerk Details:")
clerk.display_clerk_info()
```

```
Manager Details:
Employee ID: 32347
Name: Rahul
Age: 45
Salary: 120000
Department: HR
Position: Manager

Clerk Details:
Employee ID: 12345
Name: Ashish
Age: 30
Salary: 40000
Experience: 5 years
Position: Clerk
```

1.8 WAP to demonstrate the demarcation of class variable and instance variable in OOP using Employee Class.

[28]:
```
class Employee:
    # Class variable: shared by all instances
    company_name = "Bajaj Tech"
    emp_count = 0

    def __init__(self, name, age, salary):
        # Instance variables: unique to each instance
        self.name = name
        self.age = age
        self.salary = salary
        Employee.emp_count += 1 # Accessing class variable

    def display_info(self):
        """Display information of the Employee."""
```

```python
        print(f"Employee Name: {self.name}")
        print(f"Employee Age: {self.age}")
        print(f"Employee Salary: {self.salary}")
        print(f"Company: {Employee.company_name}")  # Accessing class variable

emp1 = Employee("Rahul", 45, 120000)
emp2 = Employee("Ashish", 30, 40000)

print("Employee 1 Details:")
emp1.display_info()

print("\nEmployee 2 Details:")
emp2.display_info()

# Accessing the class variable directly from the class
print(f"\nNumber of Employees (Accessed via Class): {Employee.emp_count}")

# Modifying the class variable
Employee.company_name = "New Bajaj Tech"

# Display information again after modifying the class variable
print("\nAfter changing the company name for all employees:\n")

print("Employee 1 Details:")
emp1.display_info()

print("\nEmployee 2 Details:")
emp2.display_info()
```

```
Employee 1 Details:
Employee Name: Rahul
Employee Age: 45
Employee Salary: 120000
Company: Bajaj Tech

Employee 2 Details:
Employee Name: Ashish
Employee Age: 30
Employee Salary: 40000
Company: Bajaj Tech

Number of Employees (Accessed via Class): 2

After changing the company name for all employees:

Employee 1 Details:
Employee Name: Rahul
```

```
Employee Age: 45
Employee Salary: 120000
Company: New Bajaj Tech

Employee 2 Details:
Employee Name: Ashish
Employee Age: 30
Employee Salary: 40000
Company: New Bajaj Tech
```

1.9 Write a Program to determine EOQ using various inventory models.

[29]:
```
from abc import ABC, abstractmethod
from math import sqrt
class DetModels(ABC):
    @abstractmethod
    def get_quantity():
        pass
    @abstractmethod
    def get_total_cost():
        pass
    def get_cycle_time(self, Q, lam):
        return Q/lam

class EOQ(DetModels):
    def get_quantity(self, A, lam, I, C):
        return int(sqrt((2*A*lam)/(I*C)))
    def get_total_cost(self, A, lam, I, C, Q):
        holding_cost = (I * C * (Q / 2))
        ordering_cost = A * (lam / Q)
        total_cost = holding_cost + ordering_cost
        return total_cost

class EPQ(DetModels):
    def get_quantity(self, A, lam, I, C, si):
        return int(sqrt((2*A*lam*si)/(I*C*(si-lam))))
    def get_total_cost(self, A, lam, I, C, Q, si):
        holding_cost = (I * C * Q * (si - lam)) / (2 * si)
        setup_cost = A * (lam / Q)
        total_cost = holding_cost + setup_cost
        return total_cost

class EOQ_Short(DetModels):
    def get_quantity(self, A, lam, I, C, pi):
        return int(sqrt((2*A*lam*(pi + I*C))/(I*C*pi)))
    def get_total_cost(self, A, lam, I, C, Q, pi):
        Q_r = Q * (I * C) / (pi + I * C)
```

```
        holding_cost = I * C * (Q / 2)
        ordering_cost = A * (lam / Q)
        shortage_cost = pi * (Q - Q_r) / 2
        total_cost = holding_cost + ordering_cost + shortage_cost
        return total_cost

class EPQ_Short(DetModels):
    def get_quantity(self, A, lam, I, C, si, pi):
        return int(sqrt((2*A*lam*(pi + I*C)*si)/(I*C*pi*(si-lam))))
    def get_total_cost(self, A, lam, I, C, Q, si, pi):
        Q_r = Q * (I * C) / (pi + I * C)
        holding_cost = (I * C * Q * (si - lam)) / (2 * si)
        setup_cost = A * (lam / Q)
        shortage_cost = pi * (Q - Q_r) / 2
        total_cost = holding_cost + setup_cost + shortage_cost
        return total_cost
```

[ ]:

```
# Sample Run

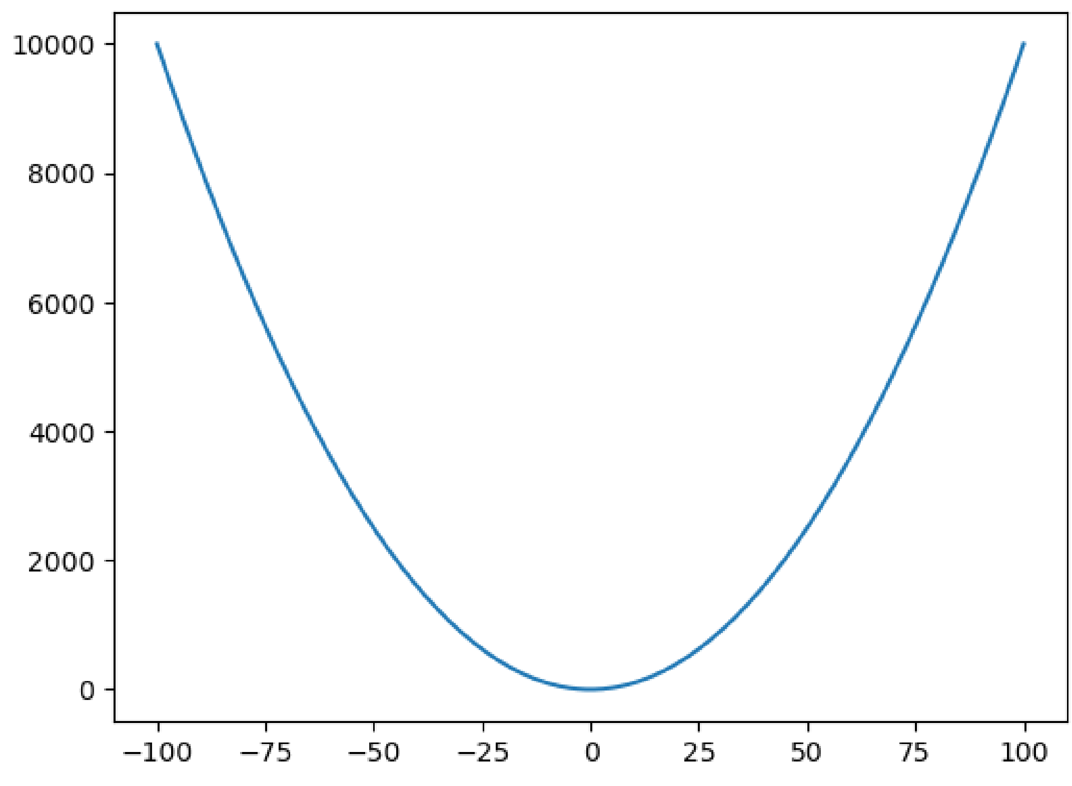
1.11 WAP to plot a graph for function $y = x^2$.

[1]:
```python
import numpy as np
import matplotlib.pyplot as plt

x = np.arange(-100,101)
y = x**2

plt.plot(x,y)
plt.show()
```



1.12 WAP to fit poisson distribution on a given data.

[ ]:

1.13 Write a python function that calculates the `pierson correlation cofficient` between two lists of numbers.

[ ]:

1.14 Write a python function that calculates `Spareman correlation cofficient`.

[ ]:

1.15 Using matplotlib plot histogram of list of numbers.

[ ]:

1.16 Write a python function that calculates the Z-score for the lists of numbers.

[ ]:

1.17 WAP to test the significance of two sample means.

[ ]:

1.18 WAP to test the goodness of fit of a given dataset on binomial distribution.

[ ]:

1.19 WAP to test significance of two sample variance.

[ ]:

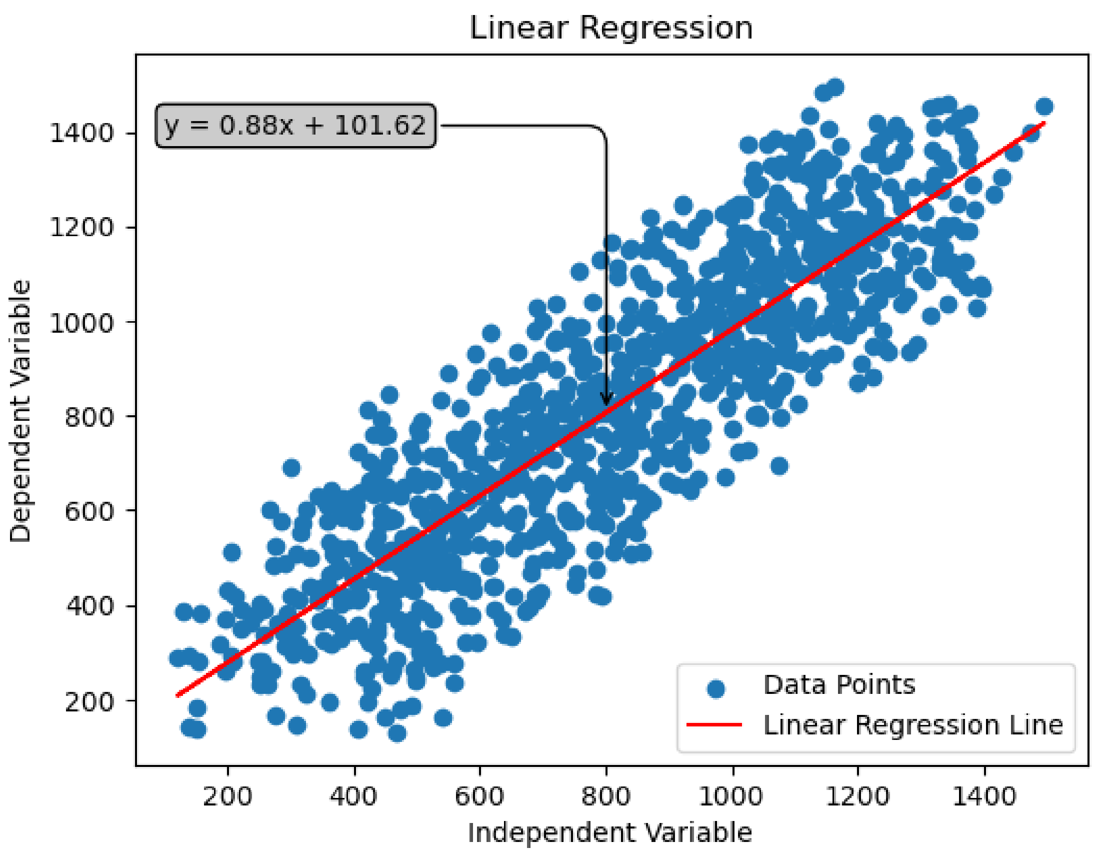
1.20 WAP to implement linear regression in python.

[37]:
```
import numpy as np
# Generating Random Data Points
n = 1000
x = np.linspace(1,1000, n) + np.random.randint(100,500, n)
y = np.linspace(10,1000, n) + np.random.randint(100,500, n)

m = (n*(x*y).sum() - x.sum()*y.sum())/(n*(x**2).sum()-(x.sum())**2)
b = (y.sum() - m*x.sum())/n
y_ = m*x + b # Equation of Linear Regression Line
```

[70]:
```
import matplotlib.pyplot as plt
plt.scatter(x,y, label = "Data Points")
```

```
plt.plot(x,y_, color = 'r', label = "Linear Regression Line")
plt.xlabel("Independent Variable")
plt.ylabel("Dependent Variable")
plt.legend(loc='lower right')
plt.title("Linear Regression")
# Adding Annotation of Equation of linear regression line
plt.annotate(f"y = {m:.2f}x + {b:.2f}",
             xy=(x.mean(), m*x.mean()+b),
             xytext=(100, y.max()-100),
             arrowprops=dict(
                 arrowstyle = "->",
                 connectionstyle = "angle, angleA = 0, angleB = 90, rad = 10"),
            bbox = dict(boxstyle ="round", fc ="0.8"),
            fontsize=10)
plt.show()
```



1.20.1 Explanaiton of Linear Regression Code

In linear regression, the goal is to fit a line that best represents the relationship between a dependent variable y and an independent variable x. The line is represented by the equation:

$$y = \beta_0 + \beta_1 x$$

Where:
β_0 is the y-intercept &
β_1 is the slope of the line.

To estimate β_0 and β_1, we use the method of **Least Squares**, which minimizes the sum of the squared differences between the observed values y_i and the predicted values $\hat{y}_i$ from the line. The formulae for estimating β_0 and β_1 are derived as follows:

1.20.2 Slope β_1:

$$\beta_1 = \frac{\sum_{i=1}^{n}(x_i - \bar{x})(y_i - \bar{y})}{\sum_{i=1}^{n}(x_i - \bar{x})^2}$$

The simplified slope formula is: **(Used in Code)**

$$\beta_1 = \frac{n\sum(x_i y_i) - \sum x_i \sum y_i}{n\sum x_i^2 - (\sum x_i)^2}$$

Where:
$\bar{x}$ is the mean of the x-values,
$\bar{y}$ is the mean of the y-values &
n is the number of data points.

1.20.3 Intercept β_0:

$$\beta_0 = \bar{y} - \beta_1 \bar{x}$$

The simplified intercept formula is: **(Used in Code)**

$$\beta_0 = \frac{\sum y_i - \beta_1 \cdot \sum x_i}{n}$$

1.20.4 Sum of Squared Errors (SSE):

The total error, which is minimized in this method, is the sum of squared residuals (differences between actual and predicted values):

$$SSE = \sum_{i=1}^{n}(y_i - \hat{y}_i)^2 = \sum_{i=1}^{n}\left(y_i - (\beta_0 + \beta_1 x_i)\right)^2$$

1.21 WAP to plot piechart on consumption of water in daily life.

[ ]:

```
```

1.22 WAP to plot bar chart to display result for 10th, 12th, 1st year, 2nd year, 3rd year CGPA.

[ ]:

```

```

1.23 WAP to perform various statistical measures using pandas.

[ ]:

```

```

1.24 WAP to perform read and write operations with csv files.

[ ]:

```

```

1.25 WAP to compute values of $\sin(x)$ using taylor series.

[ ]:

```

```

1.26 WAP to display the following pattern

```
    5
   45
  345
 2345
12345
```

[75]:

```python
n = int(input("Enter N:"))
for i in range(n,0,-1):
    print('  '*(i-1),end='')
    for j in range(i,n+1):
        print(j,end=' ')
    print()
```

```
        5
      4 5
    3 4 5
  2 3 4 5
1 2 3 4 5
```

1.27 WAP to find if a number or string is palindrome or not.

[102]:

```python
s = input("Enter a number or a string: ")

def isPalindrome(s):
    return s == s[::-1]

print(f"{s} is {"" if isPalindrome(s) else "NOT "}a palindrome.")
```

```
232 is a palindrome.
```

1.28 WAP to find greatest of number using loop.

[29]:
```
def greatest(l:list)->int:
    grt = l[0]
    for i in range(1,len(l)):
        if l[i]>grt:
            grt = l[i]
    return grt
```

[35]:
```
# sample run

l = [1, 2, 3, 1, 4, -5, 5, 0, -1, 1]

print("Greatest number in the given list:",greatest(l))
```

```
Greatest number in the given list: 5
```

1.29 WAP to print fibonacci series.

[ ]:
```

```

1.30 WAP to find factorial using recursion.

[12]:
```
def fac(n):
    return 1 if n==0 else n*fac(n-1)
```

[13]:
```
# Sample Run

n = int(input("Enter a number: "))
assert n>=0
print(f"{n}! = {fac(n)}")
```

```
5! = 120
```

1.31 WAP to find if a number is armstrong or not.

Armstrong Number: An integer such that the sum of the cubes of its digits is equal to the number itself.

[17]:
```
def is_armstrong(n):
    return n == sum([(int(x))**3 for x in list(str(n))])
```

[18]:
```
# Sample Run 1
n = int(input("Enter a number to check if it is Armstrong or not: "))

print(f"{n} is {"" if is_armstrong(n) else "NOT "}an Armstrong Number.")

# Sample Run 2
n = int(input("Enter a number to check if it is Armstrong or not: "))
```

```python
print(f"{n} is {"" if is_armstrong(n) else "NOT "}an Armstrong Number.")
```

```
153 is an Armstrong Number.
379 is NOT an Armstrong Number.
```

1.32 Write a menu driven program to find the reverse of a number and sum of digits.

[9]:
```python
def reverse(n):
    return int(str(n)[::-1])

def sum_of_digits(n):
    return sum([int(x) for x in list(str(n))])

while True:
    c = input("1) Reverse Number.\n2) Sum of digits.\n3) Exit. \nEnter your␣
 ↪choice (1-3):")
    if c == "3":
        print("Exit Successful")
        break
    elif c == "1":
        n = int(input("Enter the Number: "))
        print(f"Reverse of {n} is {reverse(n)}")
    elif c == "2":
        n = int(input("Enter the Number: "))
        print(f"Sum of digits of {n} is {sum_of_digits(n)}")
    else:
        print("ERROR: Please select a valid choice (1-3).")
```

```
Reverse of 123 is 321
Sum of digits of 123 is 6
ERROR: Please select a valid choice (1-3).
Exit Successful
```
